

can i select point by month and plot them in qgis

Yes, you can easily select and plot point data by month in QGIS. You can achieve this dynamically using the native Temporal Controller, through attribute filtering, or by creating visual graphs with the Data Plotly plugin. [\[1, 2, 3\]](#)

Method 1: The Temporal Controller (Animate and Filter by Month)

This is the best method if your point layer has a date/time column. [\[1, 2\]](#)

1. Right-click your point layer and open Properties.
2. Go to the Temporal tab and check the box to enable it.
3. Set the Configuration to Single Field with Date/Time and select your date column.
4. Go to View > Panels and enable the Temporal Controller.
5. Click the Animated Temporal Navigation (play icon) and use the settings to set your time steps to "1 month". You can now step through or animate your points month-by-month. [\[1, 2, 3, 4, 5\]](#)

Method 2: Extract or Export Features by Month

If you want to create a permanent new layer for a specific month (e.g., January):

1. Open your Layer's Attribute Table and click the Select Features by Expression (Epsilon ϵ icon) at the top.
2. Type in an expression to isolate your chosen month. For example:
`month("Your_Date_Field") = 1`
3. Click Select Features.
4. Right-click your layer in the Layers Panel, select Export > Save Selected Features As... to save those specific points as a new layer. [\[1, 2, 3\]](#)

Method 3: Rule-Based Symbology (Visual Sorting)

You can filter points visually without duplicating your dataset. [\[1, 2\]](#)

1. Open the layer Properties and go to the Symbology tab.
2. Change the drop-down at the top from *Single Symbol* to *Rule-based*.
3. Add a new rule with the expression `month("Your_Date_Field") = 1` and name it "January".

4. Repeat this for all 12 months. This allows you to toggle the visibility of different months using the checkboxes directly in the Layers panel. [\[1\]](#)

Method 4: The Data Plotly Plugin (Chart the Data)

If you just want to plot the distribution of points over the months rather than on a map, use the Data Plotly plugin. [\[1\]](#)

1. Go to Plugins > Manage and Install Plugins, search for Data Plotly, and install it.
2. Open the Data Plotly panel and select Bar Plot or Scatter Plot.
3. Set the X-axis to extract the month: `month("Your_Date_Field")`.
4. Click Create plot to visually chart how many points occurred in each month. [\[1\]](#), [\[2\]](#)
